Kanban Task Board — Full-Stack Challenge

Important Note: We recognize that this is a very time-consuming assessment, and we appreciate the time and effort you put into completing it. To protect the integrity of our hiring process, you are not permitted to upload or publicly share the assessment PDF anywhere on the internet. Additionally, you may not publicly post your final submission link on LinkedIn, GitHub profiles, personal websites, or other public platforms. However, you are welcome to include a link to your working demo on your resume if you would like to showcase your work when applying for other opportunities.

🚀 Task Board Assessment Challenge

🎯 **Goal:** Build a beautiful, fully-featured Kanban-style task board where users can create tasks, drag them across board sections, and manage work visually — inspired by tools like Asana and Linear.

⏱️ **Time:** 3–6 hours (max 12 hours if you're unfamiliar with the tech stack)

💰 **Cost:** $0 — use free tiers only.

✅ **Required Tech**

- **Supabase** (Free Tier) — database & auth
- **GitHub** (Free Tier) — version control and code sharing

🧩 **Optional Languages / Frameworks**

- React / React Native
- TypeScript
- Go (for backend API, optional)

Use what you're strongest in. You do not need to use all of them.

🎨 **Design — This Is a Priority**

Design quality will be heavily evaluated. We want the app to look and feel polished — not like a generic todo list. Think clean, modern, and intentional.
Take inspiration from tools like **Asana**, **Linear**, and **Notion**. Your board should feel like something a team would actually want to use every day.

Things we're looking for:

- A cohesive color palette and typography system
- Clear visual hierarchy between board sections and task cards
- Smooth drag-and-drop interactions
- Thoughtful empty states, loading states, and error handling
- Mobile-friendly or responsive layout is a plus

🗂️ **The Board (Required)**

Build a **Kanban-style drag-and-drop board** with the following default columns:

- **To Do**
- **In Progress**
- **In Review**
- **Done**

Users must be able to **drag tasks between columns** to update their status. The board should update in real time (or on drop).

🗄️ Database (Supabase)

Create a tasks table with the following fields:

Field	Type	Notes
id	uuid	primary key
title	text	required
status	text	todo, in_progress, in_review, done
user_id	uuid	tied to guest session
created_at	timestamp	auto-set

Bonus fields (recommended):

- description (text)
- priority (low / normal / high)
- due_date (date)
- assignee_id (uuid, references a team member)

Tasks must persist in Supabase with RLS enabled.

👤 Guest Accounts (Required)

Your app must support **guest accounts** so each user only sees their own tasks.

- Use **Supabase Auth anonymous sign-in** (no email/password required)
- Create a guest session automatically on first app launch
- Store each task with a user_id tied to the guest user
- Enable **Row Level Security (RLS)** so users can only read/write their own data

Expected behavior:

- User A creates tasks and only sees User A's tasks
- User B creates tasks and only sees User B's tasks

🖥️ Frontend (Required)

Build a web frontend or React Native app.

Your app must allow users to:

- View their task board with columns
- Create a new task (with a title, and optionally description, priority, due date)
- Drag tasks between columns to update their status
- See loading and error states clearly

⭐ Advanced Features — Highly Recommended if You Want to Stand Out

These features are optional but **strongly encouraged**. They will meaningfully differentiate your submission. Pick any combination:

1. 👥 Team Members & Assignees

- Allow the user to create a small "team" by adding members (name + optional avatar/color)
- Show team members in the board UI
- Let users assign one or more team members to a task
- Display assignee avatars on task cards

2. 💬 Task Comments

- Let users open a task detail panel and write comments
- Show comments in chronological order with a timestamp
- Store comments in a separate comments table in Supabase

3. 📋 Task Activity Log

- Track the history of changes to a task (status changes, edits, assignments)
- Show a timeline of activity inside the task detail view
- Example: *"Moved from To Do → In Progress · 2 hours ago"*

4. 🏷️ Labels / Tags

- Let users create custom labels (e.g. "Bug", "Feature", "Design")
- Assign multiple labels to a task
- Filter the board by label

5. 🗓️ Due Date Indicators

- Highlight tasks that are due soon or overdue directly on the card
- Show a visual indicator (e.g. colored badge, icon) based on urgency

6. 🔍 Search & Filtering

- Add a search bar to filter tasks by title
- Add filters for priority, assignee, or label

7. 📊 Board Summary / Stats

- Show a small summary: total tasks, tasks completed, tasks overdue
- Could live in a sidebar or header area

🛠️ Backend (Optional)

You may either:

- Call Supabase directly from the frontend, or

- Build a small API (Go optional) with endpoints to get tasks, create tasks, and update tasks

---

🌐 **Hosting (Required)**

Host your frontend so we can use a live demo. Free options:

- Vercel
- Netlify
- Cloudflare Pages

Include the live URL in your final document.

🔐 **Access & Sharing**

GitHub: Make your repository **public**, or share it as a private repo and send us the link directly. You do not need to add us as a collaborator.

Supabase: Share **read-only access to your database schema** by including the full SQL schema in your final document. You may also share a screenshot of your table structure from the Supabase dashboard. You do not need to add us as a project member.

⚠️ Do not share your Supabase service role key. Use only the public anon key in your frontend. Do not commit secrets to GitHub.

📄 **Final Deliverable**

Submit one .pdf or .docx file named: firstname_lastname_task_manager_assessment.pdf

Include:

- A short overview of your solution and design decisions
- A link to your **live frontend app**
- A link to your **GitHub repository**
- Your **full database schema** (SQL or clear description)
- Setup instructions to run locally
- Which advanced features you built (if any) and how they work
- Tradeoffs and what you'd improve with more time

✅ **What We Evaluate**

- Design quality — does it look polished and intentional?
- Board functionality — drag-and-drop, columns, task management
- Frontend usability and state handling

- Database schema and persistence
- Security awareness (RLS, no exposed keys)
- Advanced features (optional but differentiating)
- Code quality and structure
- Live app execution
- Clarity of final document

📩 **Submission:** Upload your PDF or Word document to Google drive and follow the instructions to share the link in the Google Form.
